Task 5

Question:

**Explain z-index with code example.

Answer:

This property used to control the layering of positioned elements and flex or grid items.

`z-index` used to specify stacking order of elements on a web page. Elements with a higher `z-index` value are displayed in front of those with a lower value. The `z-index` property only works on positioned elements

It has properties like : `absolute` , `relative` , `fixed` , or `sticky
