Task 2

Question:

**Explain the difference b/w Absolute and Relative positioning.

**Answer:

- **Absolute Positioning:**

  In Absolute positioning the element relative to its closest positioned ancestor. If there isn't one, it's positioned relative to the document body. It removes the element from the normal document flow. It uses the properties `top`, `right`, `bottom`, and `left` to specify its position.

**Example

Let's suppose I have a class named `absoulute-box`

```css
.absolute-box {
            position: absolute;
            top: 20px;
            left: 30px;
        }
```

- **Relative Positioning:**

  Positions the element relative to its normal position. The element stays in the document flow. Its normal position. Setting the `top, right, bottom, and left`

**Example:

Let's suppose I have class name `relative-box`

```css
.relative-box {
            position: relative;
            top: 10px;
            left: 15px;
        }
```
